

Review Exercise

You are supposed to create a stopwatch timer like the apple stopwatch. Here is the final layout:

When you click on the start button, the start button should be changed to a stop button and you have a lap button next to it to register the laps. Here is the layout.

When you click on lap button you will have the laps on a table view.

When you stop the timer, the timer stops, and the button should change again to start button. In this time the lap button should change to reset button as well. Look at the following layout. When you click reset, you should be in the initial state.
